

Everything you need to do — in order — to get the customer-driven jukebox live at Manor Lanes. Designed to be completed in two sessions: one ahead of time from any laptop, one at the venue when the Beelink SER5 arrives Tuesday.

ESTIMATED TIME

~20 minutes before Tuesday · ~45 minutes Tuesday on-site · ~15 minutes opening night.

Phase 1 — Cloud setup (do this anytime before Tuesday)

1.1 Create the Postgres database (Neon)

- ☐ Go to neon.tech and sign in / create an account.
- ☐ Click "New project". Name it manor-music.
- ☐ Pick the region closest to Manor Lanes (e.g. us-east-2 for the Midwest).
- ☐ When the project is created, copy the POOLED connection string. It looks like postgres://user:pass@ep-xxxx.neon.tech/manor-music?sslmode=require.
- ☐ Paste it into a notes file — you'll need it twice (Vercel + the mini PC).

WHY POOLED?

Vercel runs serverless functions that may open many connections at once. The pooled URL prevents Neon from hitting its connection limit. Direct URLs are only for migrations and we run those via the pooler too.

1.2 Create the realtime channel (Pusher)

- ☐ Go to pusher.com ! "Channels" product ! "Get started".
- ☐ Create app: name manor-music, cluster us2 (or closest), front-end React, back-end Node.
- ☐ From the "App Keys" tab, copy: app_id, key, secret, cluster.

1.3 Twilio sanity check

- ☐ Sign in to twilio.com. Confirm your account has SMS-capable U.S. number(s).
- ☐ From the console home, copy your Account SID and Auth Token.
- ☐ Note the From number in +15551234567 (E.164) format.
- ☐ Send yourself a test SMS from the Twilio dashboard to confirm delivery works.

1.4 Deploy to Vercel

- ☐ Go to vercel.com ! "Add New" ! "Project" ! import manor1974/email.
- ☐ Root Directory: set to manor-music. Framework Preset auto-detects Next.js — leave it.
- ☐ Production branch: claude/music-queue-app-Rjk1g (or merge it to main first if you prefer).
- ☐ Add all the environment variables below before clicking Deploy.

Environment variables — copy each row exactly

Variable	Value
DATABASE_URL	Neon pooled URL from step 1.1
TWILIO_ACCOUNT_SID	From Twilio console
TWILIO_AUTH_TOKEN	From Twilio console
TWILIO_FROM_NUMBER	Your Twilio number, +15551234567
PUSHER_APP_ID	From Pusher Channels app
PUSHER_KEY	From Pusher
PUSHER_SECRET	From Pusher
PUSHER_CLUSTER	us2 (or whichever you chose)
NEXT_PUBLIC_PUSHER_KEY	Same as PUSHER_KEY
NEXT_PUBLIC_PUSHER_CLUSTER	Same as PUSHER_CLUSTER
SESSION_SECRET	32+ random bytes (see note)
ADMIN_PIN	6+ digit PIN you'll memorize

PLAYER_API_KEY

32+ random bytes (see note)

GENERATING SECRETS

On any Mac/Linux terminal: `openssl rand -hex 32`. On Windows PowerShell: `[Convert]::ToHexString((1..32 | %{Get-Random -Maximum 256}))`. Save `SESSION_SECRET` and `PLAYER_API_KEY` somewhere safe — losing them logs every customer out and stops the player from authenticating.

- ☐ Click "Deploy". The build runs ``prisma migrate deploy && next build`` — Neon gets all tables created automatically.
- ☐ When deployment finishes, note your production URL (e.g. `manor-jukebox-abc123.vercel.app`). You'll paste this into the Tuesday installer.

1.5 Seed the database (one-time)

Run this from any laptop with Node 20+ installed:

```
git clone https://github.com/manor1974/email.git
cd email/manor-music
npm install
DATABASE_URL="paste-the-neon-url" npx tsx prisma/seed.ts
```

This creates default settings, the "All Music" starter station, and Fri/Sat 9pm–2am explicit-lyrics windows. You can edit any of it from `/admin` once you sign in.

1.6 Smoke test from your phone

- ☐ Open your Vercel URL on your phone in Safari (iPhone) or Chrome (Android).
- ☐ Tap Share ! "Add to Home Screen". The Manor Lanes icon should install.
- ☐ Open the home-screen icon — should launch full-screen with no browser chrome.
- ☐ Tap "Sign in to queue songs". Enter your real mobile number.
- ☐ Confirm the 6-digit code arrives via SMS within 10 seconds.
- ☐ Enter the code !' land back on home, signed in.
- ☐ Go to `https://YOUR-URL/admin/login` !' enter your PIN !' admin dashboard loads.
- ☐ Click "System health check". Every row should be green except Player (red until Tuesday — expected).

CUSTOM DOMAIN (OPTIONAL, DO ANYTIME)

In Vercel !' Project !' Domains, add `jukebox.manorlanes.com`. Vercel shows the CNAME record to add to your DNS provider. Updates the QR codes you'll print later.

Phase 2 — Tuesday on-site (when the SER5 arrives)

2.1 Unbox and physically install (~10 min)

- ☐ Mount the Beelink SER5 wherever it makes sense — behind your AV rack, on a shelf near the matrix, or velcroed to a wall.
- ☐ Connect: HDMI from the SER5 into a free input on your BZB matrix.
- ☐ Connect: USB-C/HDMI to your touchscreen for the staff DJ console.
- ☐ Connect: USB cable from SER5 to your USB DAC; RCA from the DAC into your mixer.
- ☐ Connect: Ethernet (preferred) or Wi-Fi to your network.
- ☐ Connect: 2TB external SSD via USB (where your library will live).
- ☐ Power on. First boot lands at Windows out-of-box experience.

2.2 Initial Windows setup (~10 min)

- ☐ Pick "Set up for personal use" ! "Sign-in options" ! Offline account ! name it manor with a strong password.
- ☐ Skip Microsoft account upsells. Decline OneDrive backup.
- ☐ Settings ! System ! Power: "Never" sleep, "Never" turn off screen.
- ☐ Settings ! System ! Display: set the touchscreen as Primary (the HDMI-to-matrix output is the secondary).
- ☐ Settings ! Sound: select your USB DAC as the default output. Test with any sound.
- ☐ Settings ! Windows Update: install all pending updates. Restart if prompted.
- ☐ Settings ! System ! Remote Desktop: turn ON. Note the PC name.
- ☐ Set a static IP on your router for the SER5 so RDP from your phone/laptop always works.

2.3 Run the one-line installer (~15 min)

Open PowerShell as Administrator. Right-click the Start menu ! Windows Terminal (Admin) or PowerShell (Admin). Then:

```
Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass -Force  
irm https://raw.githubusercontent.com/manor1974/email/main/manor-music/scripts/install-  
windows.ps1 | iex
```

When prompted, paste:

- SERVER_URL = your Vercel production URL (or custom domain)
- PLAYER_API_KEY = the value you saved in step 1.4
- DATABASE_URL = the Neon pooled URL from step 1.1
- LIBRARY_PATH = D:\library (or wherever your external SSD mounts)

The installer will:

- Install Node.js LTS, Git, mpv, NSSM, and Chrome via winget.
- Clone the repo to C:\manor-music.
- Run `npm install` (~3 min).
- Register ManorPlayer as an auto-start Windows service.

- Register ManorWatcher as a second auto-start Windows service.
- Drop a kiosk-mode Chrome shortcut into Startup pointing at /staff.
- Set Windows Update active hours to 02:00 !' 06:00 so updates never reboot during venue hours.

☐ When it finishes, you should see "Manor Lanes Jukebox is installed" in green.

2.4 Copy the music library

- ☐ Mount your external SSD (will appear as D: or similar). Match LIBRARY_PATH from step 2.3.
- ☐ Copy your entire Promo Only library into D:\library\... Folder layout is flexible — the scanner walks recursively.
- ☐ Music videos go in the SAME folder as their audio, with the SAME base filename and a .mp4 extension. Example:

```
D:\library\Drake\Hotline Bling (Clean).mp3
D:\library\Drake\Hotline Bling (Clean).mp4
D:\library\Drake\Hotline Bling (Explicit).mp3
```

- ☐ ManorWatcher auto-ingests within ~3 seconds of each file finishing copying. Check the SER5's screen — log line per file.
- ☐ For a sanity check, monitor the watcher log:

```
Get-Content C:\ProgramData\nssm\ManorWatcher-stdout.log -Wait
```

FIRST SCAN CAN TAKE A WHILE

A 50,000-track library reads metadata at ~30 files/sec, so a full ingest is ~30 minutes. Subsequent drops are instant. You can use the app immediately — songs become searchable as they're ingested.

2.5 Reboot and verify

- ☐ Reboot the SER5.
- ☐ It should auto-log in to the manor account.
- ☐ Chrome should launch full-screen at /staff after ~10 seconds.
- ☐ On your phone, open /admin/health. Every row should be green:
 - Database — Connected
 - Library — N playable songs (matches what you copied)
 - Settings — singleton present
 - Stations — All Music defined
 - Player — Heartbeat under 60s
 - Twilio + Pusher — Credentials present

Phase 3 — Configure for opening night (~20 min)

3.1 Define your zones and print QR codes

- ☐ On your phone, go to /admin/qr.
- ☐ Adjust the Base URL if you have a custom domain (e.g. jukebox.manorlanes.com).
- ☐ Set up your zone groups. Defaults are:
 - Lane 1–16 (range)
 - Bar (single)
 - Volleyball Court 1–4 (range)
- ☐ Add/remove groups for your actual layout. Each card embeds a unique ?location= so the system can track which zone requests come from.
- ☐ Tap Print. Use Chrome on your laptop (the print stylesheet hides the editor and prints 2-up on letter paper).
- ☐ Laminate the cards or slip them into table-tents.
- ☐ Place one at each lane, table, court, and bar position.

3.2 Set up the explicit-lyrics rules

- ☐ Go to /admin/schedule.
- ☐ Verify global windows match your policy. Defaults: Fri & Sat 9pm–2am.
- ☐ Add or remove windows as needed (e.g. add Sunday brunch silence).
- ☐ Under "Per-zone overrides" add:
 - Bar — Always allow explicit (adults-only zone)
 - Volleyball Court 1, 2, 3, 4 — Always clean (families)
- ☐ Save. Test by queuing an explicit song from a bar QR card !' it plays explicit. Same song queued from a court QR !' it auto-swaps to the clean version.

3.3 Pick the auto-DJ station

- ☐ /admin/stations !' click Activate next to "All Music".
- ☐ Optionally create a custom station (e.g. "Saturday Night Energy") with genre filters, year range, BPM range.
- ☐ Whenever the customer queue empties, the active station picks the next track honoring all cooldowns and the explicit window.

3.4 Tune the rules

- ☐ /admin/settings:
 - Max songs per customer — default 3. Bump to 5 for quiet nights, lower to 2 if one customer keeps dominating.
 - Song cooldown — default 4 hours. Stops the same track being requested twice in a shift.
 - Artist cooldown — default 45 min. Stops three Taylor Swift songs back to back.

3.5 Volume and playback

- ☐ /admin/playback !' set initial volume (try 70 to start).
- ☐ Queue a test song from your phone. Listen on the venue speakers.
- ☐ Adjust volume with the slider — should change within a second.
- ☐ Test pause/play. Test skip. These will be your most-used controls during service.

3.6 Test music videos on the matrix

- ☐ Find a song in /admin/qr that has a VIDEO badge (one where you have both an .mp3 and a .mp4 in the library).
- ☐ Queue it from your phone.
- ☐ Route the SER5's HDMI input on your BZB matrix to a TV you can see.
- ☐ Confirm: video plays full-screen on the TV; audio comes out the mixer (USB DAC, not the TV speakers).

3.7 The TV "Now Playing" display

- ☐ On a spare TV (or whichever zone you want to use), route to the SER5's HDMI input.
- ☐ Or open /display in a separate browser tab on the SER5 and extend to another monitor.
- ☐ This shows the branded "Now Playing + Up Next" screen whenever no music video is active.

3.8 Bartender / staff training (5 min)

Show your bar staff three things:

- /staff — the DJ console for browsing by genre/decade and queuing background music.
- /admin/playback — pause for announcements, slap volume to 30 at last call.
- /admin/queue — remove anything inappropriate that slipped through the blocklist.

Bookmark these three URLs on the bar tablet or staff phones.

Phase 4 — Cancel Orangedoor (after a successful first weekend)

Don't cancel until you've had at least one busy night running on the new system. When you're confident:

- ☐ Log in to your Orangedoor account.
- ☐ Cancel the subscription effective end of current billing period.
- ☐ Document monthly savings somewhere — you'll want the number when budget time comes.

Day-2 operations cheat sheet

Adding new music

RDP into the SER5 from anywhere. Copy MP3s (and matching .mp4s) into D:\library. The watcher auto-ingests within 3 seconds. Anyone who had requested that song gets an SMS.

Blocking a song

Search for it in /admin/qr or /staff !' tap Block. Or go to /admin/blocklist to see and lift existing blocks.

Banning a customer

/admin/customers !' search by phone or name !' Ban. Their pending songs are removed immediately and they can't queue more.

Reports

/admin/reports — top songs (7/30 days), day×hour heatmap, plays by zone, top songs by zone, most-requested unfulfilled. Export 7/30/90-day CSV for Excel.

When something breaks

First stop: /admin/health on your phone. Tells you in 2 seconds whether it's the database, the player, Twilio, or Pusher.

Player log: RDP in, run

```
Get-Content C:\ProgramData\nssm\ManorPlayer-stdout.log -Tail 50
```

Service restart: open Services.msc, find ManorPlayer or ManorWatcher, right-click !' Restart.

Full reboot: 4am Tuesday morning is the scheduled reboot window. Most issues clear on reboot.

Final pre-launch checklist

The day before opening, verify all of:

- ☐ /admin/health is fully green
- ☐ A test customer (your own phone) can sign in and queue a song end-to-end
- ☐ Audio plays through the venue speakers at acceptable volume
- ☐ A music video routes to the right TV
- ☐ QR codes are printed, laminated, and placed at every zone
- ☐ Bartenders know where /staff and /admin/playback are bookmarked
- ☐ Library has at least 5,000 songs ingested
- ☐ Auto-DJ station is activated

- ☐ Explicit schedule + zone overrides are set
- ☐ You know your ADMIN_PIN

Open the doors.
